API Integrations Platform

Description
API Gateway solution for API development teams, both consuming and providing APIs.

Tags: API, Azure, AWS, On-Prem, OP-ATLAS, OP-DEVELOPER, ONTOLOGICAL, MANAGED

AVAILABLE CHOOSE

Async API Integrations Platform

Description
Kafka-based event backbone that empowers event-driven architecture at OP.

Tags: AWS, AWS, MANAGED

AVAILABLE CHOOSE

Azure Sandbox

Description
Sandbox environment Azure subscription for OP employees that are exploring to experiment with Azure.

Tags: CLOUD, AZURE

AVAILABLE CHOOSE

CASSA in Azure

Description
Containerized application framework in Azure, tailored for OP environment.

Tags: CLOUD, AZURE, AWS, AWS, MANAGED

AVAILABLE CHOOSE

CASSA On-prem

Description
On-premise Container-Aligned Secure Service Architecture - a framework to Microsoft application development at OP.

Tags: CLOUD, AWS, On-Prem, MANAGED

AVAILABLE CHOOSE

Centralized Log Management

Description
Modularized telemetry (LOG) enables secure, efficient, and compliant collection, storage, and analysis of all your system and application logs in one place.

Tags: AWS, MANAGED, CLOUD

AVAILABLE CHOOSE

Common ETL Platform

Description
The Common ETL Platform is a centralized service managed by the Data Integrations team, where Azure Data Factory pipelines are developed and operated.

Tags: ETL, AZURE, MANAGED, AWS

AVAILABLE CHOOSE

DataStage ETL Platform

Description
The DataStage ETL Platform offers a Platform-as-a-Service (PaaS) solution for teams requiring on-premise data integration capabilities using IBM DataStage.

PRODUCT

CASSA in Azure 1.0

OVERVIEW ORDER DETAILS SECURITY TERMS OF USE SUPPORT

Product description

CASSA in Azure streamlines the development, deployment, and operation of Java Spring Boot applications by applying platform engineering principles on Azure. Built on Azure Kubernetes Service (AKS), it serves as both the runtime and platform. As the evolution of the on-premises CASSA platform, it enables the migration of modernized applications to the cloud.

CASSA, which stands for Container-Aligned Secure Service Architecture, boosts productivity and efficiency by offering a robust framework and supported platform for development. It empowers teams to focus on innovation and deliver high-quality applications, while ensuring operational consistency, efficiency, and scalability.

The underlying AKS platform, OP Azure Container Platform (ACP), was initially created for CASSA applications but is positioned to support other containerized workloads in the future, extending platform engineering benefits across a broader range of services.

Faster time to production

1.Ready made integrations for Platform services 2.Faster time to production

Azure secret management (Key vault)

CLM (KLH)

Apigee

Databases (PostgreSQL)

Platform managed Azure resources

Infrastructure as code IaC (Helm)

GitOps

The Platform covers many production concerns (MCF)

3.Secure and compliant by default

4.Easy to operate

Secure and audited solutions

Secure baseline (SCF)

Secure base images

Standardized production practices

Quest of platform products that stick

Hi, I would like to build an app. I'm thinking between CASSA and Azure Native stack. What I should take into account?

Hubert - AI Chat

When deciding between CASSA and Azure Native stack for building your app, here are the key considerations based on OP Financial Group's internal guidance:

Overview

- **CASSA (Container-Aligned Secure Service Architecture)** is OP's implementation of cloud-native architecture focused on Java Spring Boot applications running on Azure Kubernetes Service (AKS). It provides a regulated, streamlined path for legacy modernization with standardized deployment patterns, observability, and compliance.
- **Azure Native Stack** means leveraging Azure cloud services directly (e.g., Azure Functions, Logic Apps, APIM, Event Grid) to build cloud-native applications with flexibility and innovation.

Key Points to Consider

1. Architectural Model

- **CASSA:**
 - Best suited for containerized Java Spring Boot microservices.
 - Provides a robust framework with managed dependencies, shared libraries, and built-in integrations (Key Vault, PostgreSQL, Apigee).
 - Focuses on operational consistency, security, and compliance.
 - Uses Helm charts and GitOps for deployment automation.
- **Azure Native Stack:**
 - Best suited for building cloud-native applications using Azure cloud services.
 - Provides a regulated, streamlined path for legacy modernization with standardized deployment patterns, observability, and compliance.
 - Focuses on operational consistency, security, and compliance.
 - Uses Helm charts and GitOps for deployment automation.

Quest of platform assets that are supported

I was thinking to build a new app that would utilize account- and customer info API's
could you recommend me what to use and who to contact?

The screenshot shows the 'API Models' section of the OP Atlas interface. It features a search bar at the top and a grid of 24 API model cards. Each card displays the model name, a brief description, and a 'View' button. The models are organized into categories like 'Account', 'Product', and 'Transaction'.

Model Name	Description	View

The screenshot shows the OP Atlas homepage. At the top, there's a navigation bar with links like 'Swagger Preview', 'Guide', 'OP REST API Spec', 'API Models', 'API Products', 'My Atlas', and 'VALTIER RAGGIONE'. Below the navigation bar is a large banner with the text 'Home of the API' and 'Manage and consume OP's APIs - all in one place!'. The banner features a background image of a lighthouse with a red light. Below the banner is a 'Welcome to OP Atlas PROD!' section with a cartoon character and text explaining the platform. At the bottom, there are two columns of links for 'Developers' and 'Product Owners'.
